

— AI ACT — 2 MONTHS LEFT —

HIRING A LAWYER FOR AI ACT COMPLIANCE IS YOUR MOST EXPENSIVE MISTAKE.

SCORRI ↑

The problem isn't reading the regulation. It's documenting how your systems decide.

AI ACT IS A TECHNICAL PROBLEM, NOT A LEGAL ONE

01

Map every workflow that uses an LLM or AI automation

02

Document how each system makes automated decisions

03

Prove human oversight exists where the regulation requires it

04

Create audit logs for every automated decision

05

Classify the risk level of each AI system in use

— WHAT'S ACTUALLY HAPPENING —

An abstract diagram in the top right corner featuring a network of nodes and lines. It includes a large dark blue circle, a smaller dark blue circle, and several brown squares. These are connected by thin white lines, some of which have small blue dots at their endpoints.

€4,000

Spent on legal consulting by SMBs that
haven't opened a single workflow yet

The audit ends up in a drawer. The workflows stay exactly as before.

03

DO THIS BEFORE YOU CALL A LAWYER

1

STEP 1

List every AI system in use — n8n, Make, any LLM in any process

2

STEP 2

Document how each workflow makes automated decisions

3

STEP 3

Add audit logs and human oversight to every critical node

TECHNICAL

not legal

TECHNICAL AUDIT

Someone who knows n8n, Make, and LLMs from the inside — not someone who translates a regulation.

- ✓ Full inventory of AI systems and decision flows
- ✓ Audit-ready documentation per workflow
- ✓ Human oversight layer added where required

— THE COMMON ERROR •

STARTING WITH LEGAL CONSULTING

LA SOLUZIONE

Document your workflows first with someone who knows them from the inside. Then bring that documentation to the lawyer.
