

VIBE CODING KILLED MY PERFECTIONISM.

I shipped more in 30 days than in the 6 months before.

THIS WAS ME 60 DAYS AGO.

02

01

Spent 2 weeks planning architecture before any code

02

Refactored functions that hadn't run once

03

3 projects shelved because they weren't ready

04

Zero shipped tools. Plenty of clean repo structure.

5

Working prototypes shipped in 30 days. The
30 days before: 0.

Builder transparency — June 2026

03

HOW I BUILD IN 2026.

05

- 1** 01 Describe the problem in plain English to Claude
- 2** 02 Get a working prototype — target under 1 hour
- 3** 03 Run it on real data immediately
- 4** 04 Ship or scrap — no 'almost done' limbo
- 5** 05 Polish only what survives day 3

AI Coding

CLAUDE CODE

Describe it, get a prototype. No copy-paste, no context loss.

- ✓ Full codebase context — no copy-paste
- ✓ Runs terminal commands, reads files, edits inline
- ✓ Turns a 4-hour task into a 40-minute loop

— LET'S BE CLEAR •

IL MITO

**VIBE CODING MEANS WRITING MESSY,
UNMAINTAINABLE CODE**

LA REALTÀ

**IT MEANS NOT OPTIMIZING CODE
THAT MIGHT GET DELETED. IF IT
SURVIVES, YOU REFACTOR.**

— YOUR TURN •
